

BATCH RENAMER

Documentation

1.0.0

By Simon Sanchez

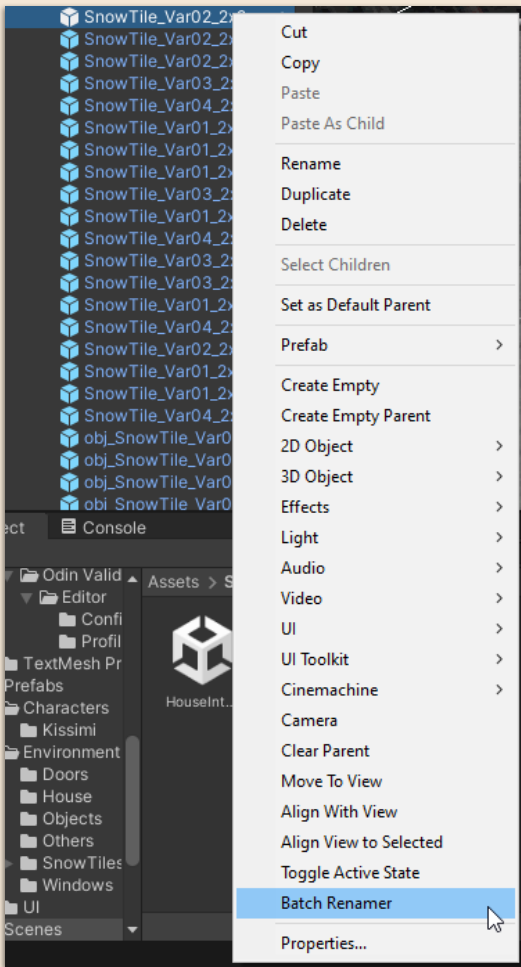

Introduction

Batch Renamer is a simple tool that allows you to **easily rename all the selected objects in your Hierarchy**.

Some of the features of **Batch Renamer** are:

- Getting a **live preview** of the **'new name'** of the object.
- **Replacing** part of an objects name with another text.
- Adding a **suffix** and/or a **prefix**.
- **Removing specific characters** from a name (*Spaces, Punctuation and more.*)
- **Changing the casing** of a name (*UPPERCASE, lowercase.*)

This is a simple and comprehensive guide on how the different settings of **Batch Renamer** work.

To get started, you can **select objects in your hierarchy** and find **'Batch Renamer'** on the context menu.

Otherwise, you can open it by going to **GameObject → Batch Renamer**.

Index

- Introduction..... 2**
- Replace..... 4**
- Set..... 5**
- Strip 6**
- Others 7**
- End 8**

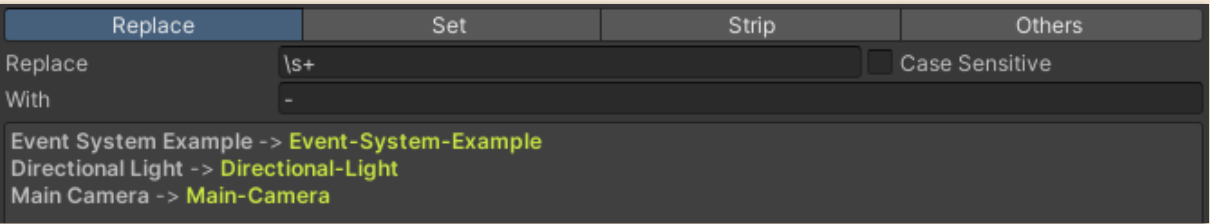

Replace

The **Replace** option allows you to replace **all** matches of a string with another string (*including an empty one.*)

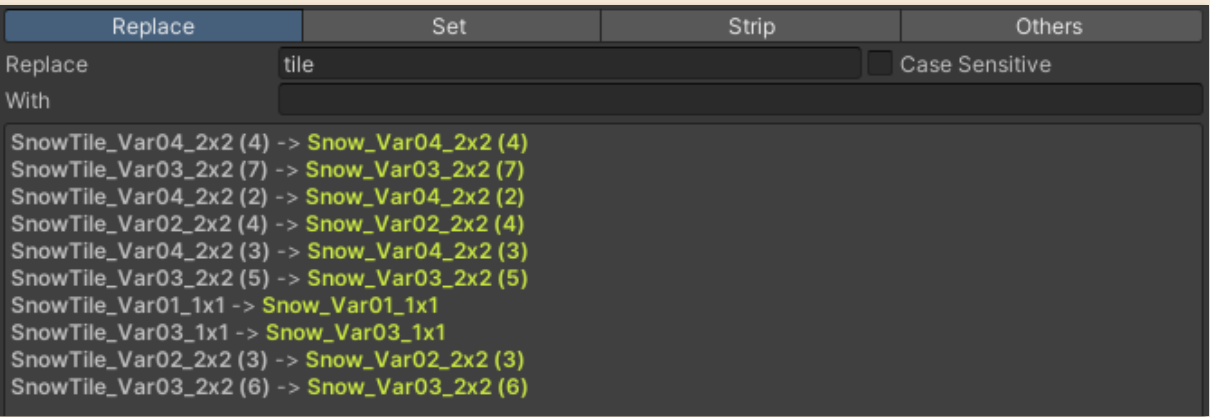

- **Replace:** This is the text that will be replaced.
- **Case Sensitive:** This allows you to ignore or not casing on the string to search for that will be replaced.
- **With:** This is the string that will replace the text.

The **Replace** field has **Regex support**. You can [learn more about Regex in the official .NET documentation](#).

In the example below, `\s+` will find all white spaces (if any) and it will then replace them with `-`.

The below example will find the string `'tile'` (*ignoring casing*) and replacing it with an **empty string**, essentially removing `'tile'` from the object name.

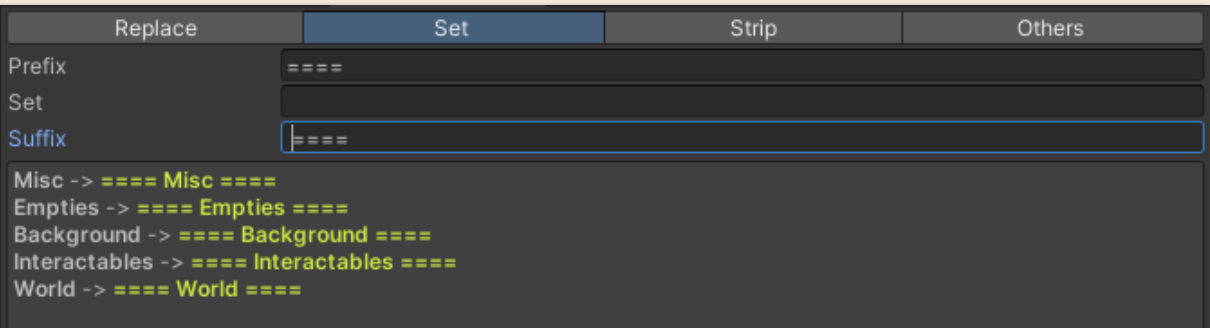

Set

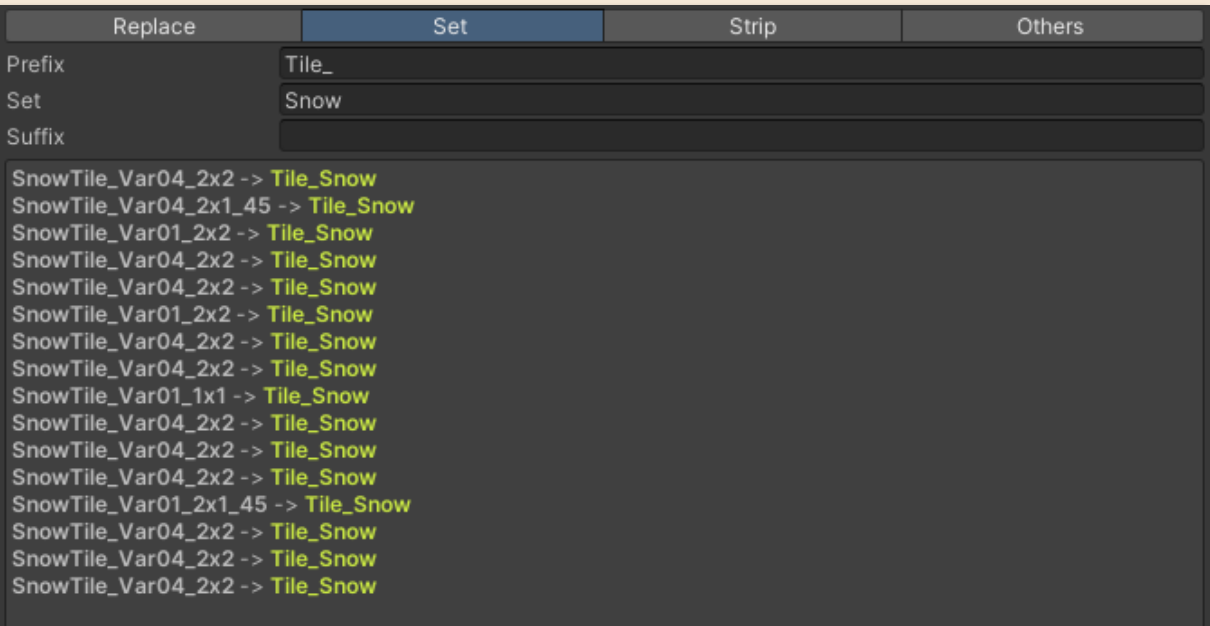

The **Set** option allows you to define a **prefix**, a **suffix** and to **set the whole name** of an object to a specific string.

- **Prefix:** This text will be added **before** the object name.
- **Set:** *If not empty*, this will be the object name.
- **Suffix:** This text will be added **after** the object name.

In the example below, we're adding a **suffix** and **prefix** to multiple empty game objects that might act as *separators* in the **Hierarchy**.

In this other case, we're *simplifying* the name of some objects by just specifying the `'Tile_'` **prefix** and **setting** the name to `'Snow'`

Strip

Strip allows you to **remove specific characters** from either the **left-side, right-side** or **both sides** of the objects name.

- **Custom Characters:** In this field you can insert any extra character/s to be removed.
- **Predefined Sets**
 - **Spaces:** Removes empty spaces.
 - **Digits:** Removes digits/numbers (**0...9**)
 - **Punctuation:** Removes punctuation characters (**. , ; :**)
- **Sides**
 - **Start:** Removes from the left-side of the name.
 - **End:** Removes from the right-side of the name.
 - **Both:** Removes from both the left and right side of the name.

Here's an *'extreme'* example to demonstrate all of these fields, the original name of the object is `1 GameObject.1 (2) ``.

Replace	Set	Strip	Others
Custom Characters ()			
☒ Spaces ☒ Digits ☒ Punctuation			
Start		End	Both
1 GameObject.1 (2) -> GameObject.1 (2)			

Running the tool **once** with these settings will change the name to `` GameObject.1 (2) ``.
Running it again will change the name to ``GameObject.1 ( ``.
Finally, running it again we will be left with ``GameObject``.

Others

The last option is **others**, which contains some **miscellaneous modifiers**.

- **Remove After:** Removes all text **after** the text in the field.
- **Remove Before:** Removes all text **before** the text in the field.
- **Casing**
 - **Default:** Doesn't affect the casing of the objects name
 - **Lowercase:** Converts the name to lowercase.
 - **Uppercase:** Converts the name to uppercase.

In the example below, we're removing after `` ``, before ``obj_`` and converting the name to uppercase.

Replace	Set	Strip	Others
Remove After	` `		
Remove Before	obj_		
Default		Lowercase	Uppercase
obj_SnowTile_Var03_2x2 (3) -> SNOWTILE_VAR03_2X2 obj_SnowTile_Var01_1x1_45 (1) -> SNOWTILE_VAR01_1X1_45 obj_SnowTile_Var03_2x2 (2) -> SNOWTILE_VAR03_2X2 obj_SnowTile_Var03_2x2 (4) -> SNOWTILE_VAR03_2X2 obj_SnowTile_Var02_1x2 (1) -> SNOWTILE_VAR02_1X2 obj_SnowTile_Var03_2x2 -> SNOWTILE_VAR03_2X2 obj_SnowTile_Var02_1x2 -> SNOWTILE_VAR02_1X2 obj_SnowTile_Var04_1x1 (2) -> SNOWTILE_VAR04_1X1 obj_SnowTile_Var03_1x2 -> SNOWTILE_VAR03_1X2 obj_SnowTile_Var03_1x1_45 (1) -> SNOWTILE_VAR03_1X1_45 obj_SnowTile_Var01_2x2 (1) -> SNOWTILE_VAR01_2X2 obj_SnowTile_Var03_1x2 (1) -> SNOWTILE_VAR03_1X2 obj_SnowTile_Var03_2x2 (1) -> SNOWTILE_VAR03_2X2 obj_SnowTile_Var02_1x1 -> SNOWTILE_VAR02_1X1 obj_SnowTile_Var02_2x2 (1) -> SNOWTILE_VAR02_2X2 obj_SnowTile_Var01_1x1 (1) -> SNOWTILE_VAR01_1X1 obj_SnowTile_Var02_2x2 (2) -> SNOWTILE_VAR02_2X2 obj_SnowTile_Var02_1x1 (1) -> SNOWTILE_VAR02_1X1 obj_SnowTile_Var04_2x2 (1) -> SNOWTILE_VAR04_2X2			

End

This little tool was made out of personal necessity as **Unity** does not (yet) ship with something like this. It was heavily inspired by **Blender's** batch rename option.

If you found it useful, feel free to share it with someone else who also might.
